

Title: Secure Network Design, Penetration Testing, and Encrypted Traffic Analysis

1. Introduction

This task focuses on creating a secure network design involves segmenting network to limit the attack surface and firewalls for traffic control. Penetration Testing with Metasploit identifies vulnerability through scanning and exploiting the discovered vulnerability on the test environment which is Metasploit. Analyzing the encrypted network traffic using Wireshark and Python libraries such as Scapy or Pyshark without decrypting content

2. Tools Used

- Operating system: Kali Linux
 - Metasploitable 2
 - Python 3
 - Wireshark
 - Scapy library
 - Pyshark library
 - Cisco Packet Tracker
 - Metasploit
-

3. Secure Network Design

A secure topology for 10-20 devices places public-facing web servers in a DMZ separated by firewalls from internal VLANs:

- Employees (VLAN 10)
- Guests (VLAN 20)
- Internal Servers (VLAN 30)

Internal server in DMZ with strict access controls, which got protected by Firewall

Logical Topology To Build

1. 1 x Router – will act as firewall + router.
2. 1 x Layer 2 Switch for VLAN 10, 20, 30.
3. PCs:
 - a. Employee VLAN 10: 10 PCs
 - b. Guest VLAN 20: 5 PCs
 - c. Management VLAN 30:
4. 1 x DMZ Web Server (on a separate subnet)
5. 1 x Cloud for providing Internet

Subnet

- VLAN 10 (Employees): 192.168.10.0/24
 - VLAN 20 (Guests): 192.168.20.0/24
 - VLAN 30 (Internal servers): 192.168.30.0/24
 - DMZ (Web server): 192.168.100.0/24
 - Outside/Internet: 203.0.113.0/30
-

4. Switch Setup & Configuration

Configuration:

On Switch head to CLI for configuration

Use the following commands to configure the Switch:

- 1.enable
- 2.config t
- 3.vlan 10
- 4.name EMPLOYEE
- 5.vlan 20
- 6.name GUEST
- 7.vlan 30
- 8.name SERVERS

Assign access ports:

- Fa0/1–Fa0/10 → VLAN 10 (employees)
- Fa0/11–Fa0/15 → VLAN 20 (guests)
- Fa0/16–Fa0/18 → VLAN 30 (internal servers)
- Fa0/24 → trunk to router

On Switch head to CLI for configuration

Use the following commands to configure the Switch:

- 1.interface range fa0/1 - 10
 - a.switchport mode access
 - b.switchport access vlan 10
- 2.interface range fa0/11 - 15
 - a.switchport mode access
 - b.switchport access vlan 20
- 3.interface range fa0/16 - 18
 - a.switchport mode access
 - b.switchport access vlan 30
- 4.interface fa0/24
 - a.switchport mode trunk
 - b.switchport trunk
 - c.encapsulation dot1q
 - d.switchport trunk allowed vlan 10,20,30

```

Switch#show vlan brief

VLAN Name          Status    Ports
---- -- -- --
1   default        active    Fa0/21, Fa0/22, Fa0/23, Fa0/24
                           Gig0/1, Gig0/2
10  Employee       active    Fa0/1, Fa0/2, Fa0/3, Fa0/4
                           Fa0/5, Fa0/6, Fa0/7, Fa0/8
                           Fa0/9, Fa0/10
20  Guests         active    Fa0/11, Fa0/12, Fa0/13, Fa0/14
                           Fa0/15
30  Servers        active    Fa0/16, Fa0/17, Fa0/18
40  test           active    Fa0/19, Fa0/20
1002 fddi-default  active
1003 token-ring-default  active
1004 fddinet-default  active
1005 trnet-default   active
Switch#show interfaces trunk
  
```

Successfully Configured the Switch

5. Router Setup & Configuration

Configuration:

On Router head to CLI for configuration

Use the following commands to configure the Switch:

- 1.enable
- 2.conf t
- 3.interface g0/0
 - a.no shutdown
- 4.! VLAN 10 – Employees
- 5.interface g0/0.10
 - a.encapsulation dot1Q 10
 - b.ip address 192.168.10.1 255.255.255.0
- 6.! VLAN 20 – Guests
- 7.interface g0/0.20
 - a.encapsulation dot1Q 20
 - b.ip address 192.168.20.1 255.255.255.0
- 8.! VLAN 30 – Servers
- 9.interface g0/0.30
 - a.encapsulation dot1Q 30
 - b.ip address 192.168.30.1 255.255.255.0

Gateway Setup on Hosts:

- VLAN 10 PCs: gateway 192.168.10.1
- VLAN 20 PCs: gateway 192.168.20.1
- VLAN 30 servers: gateway 192.168.30.1

Router1

Physical Config **CLI** Attributes

IOS Command Line Interface

```

Router(config-subif)#!VLAN 20 -Guests
Router(config-subif)#interface g0/0.20
Router(config-subif)#
%LINK-5-CHANGED: Interface GigabitEthernet0/0.20, changed state to up
encapsulation dot1Q 10

%Configuration of multiple subinterfaces of the same main
interface with the same VID (10) is not permitted.
This VID is already configured on GigabitEthernet0/0.10.

Router(config-subif)#encapsulation dot1Q 20
Router(config-subif)#ip address 192.168.20.1 255.255.255.0
Router(config-subif)#! VLAN 30 - Servers
Router(config-subif)#interface g0/0.30
Router(config-subif)#
%LINK-5-CHANGED: Interface GigabitEthernet0/0.30, changed state to up
encapsulation dot1Q 30
Router(config-subif)#ip address 192.168.30.1 255.255.255.0
Router(config-subif)#end
Router#
%SYS-5-CONFIG_I: Configured from console by console

Router#interface g0/1

```

Successfully Configured Router

6. DMZ setup

Use Routers g0/1 interface for setting up DMZ

Use the following command in Router to setup DMZ:

- interface g0/1
- ip address 192.168.100.1 255.255.255.0
- no shutdown

Make a connection from the Router to DMZ webserver

Configuring DMZ web server:

- IP: 192.168.100.10
- Mask: 255.255.255.0
- Gateway: 192.168.100.1

The Web server in the DMZ segment the traffics are strictly filtered

```

Router>enable
Router#conf t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#interface g0/2
Router(config-if)#ip address 203.0.113.0 255.255.255.252
Bad mask /30 for address 203.0.113.0
Router(config-if)#no shutdown

Router(config-if)#
%LINK-5-CHANGED: Interface GigabitEthernet0/2, changed state to up

%LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/2, changed state to up

Router(config-if)#iproute 0.0.0.0 0.0.0.0 203.0.113.2
^
% Invalid input detected at '^' marker.

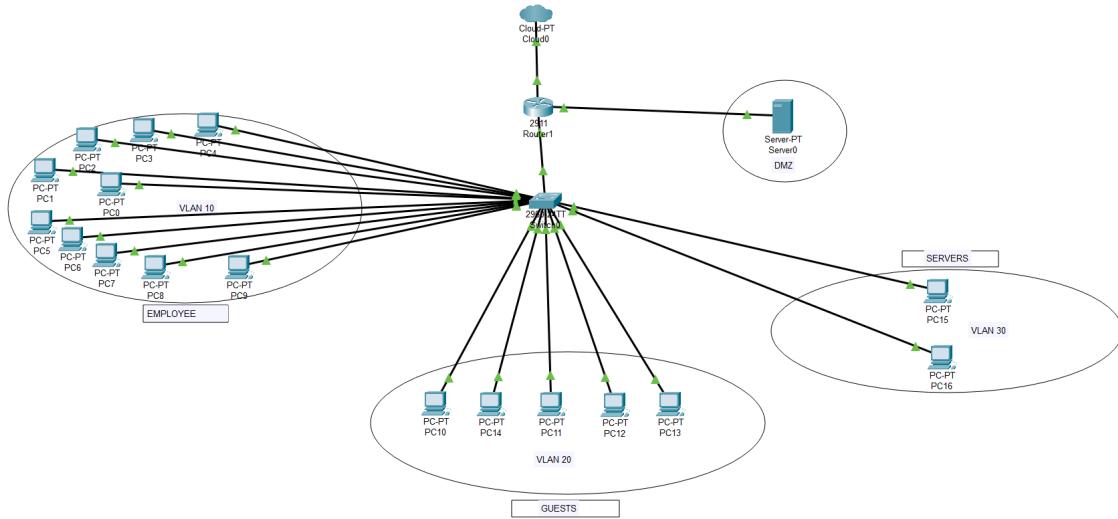

Router(config-if)#end
Router#
%SYS-5-CONFIG_I: Configured from console by console

```

Successfully Configured Router for DMZ

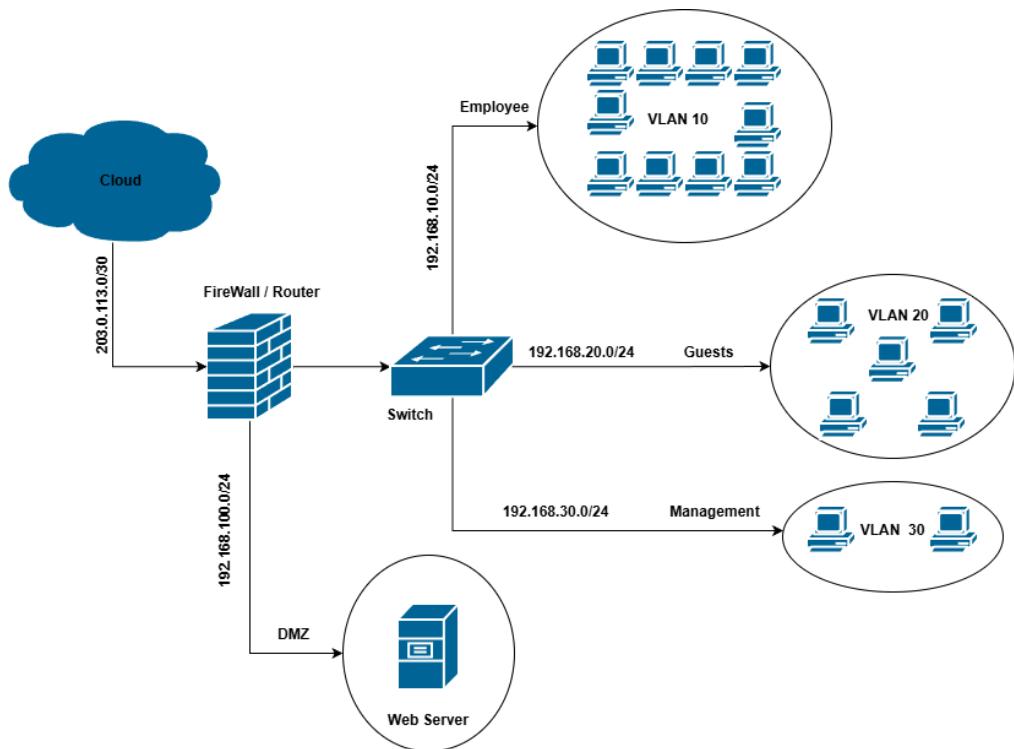

7. Network Setup

Network Setup At Cisco Packet Tracker

8. Network Topology

Network Topology

9. Metasploit Testing

Environment setup

- Attacker - Kali Linux
- Target - Metasploitable 2
- Tool - Metasploit

Before starting the Metasploit , we first need to initiate a database using :

- msfdb init

And setting up the user and database in postgresql

Powering up the Metasploit using:

- msfconsole
- db_status - verify db connection
- db_nmap -sV -T5 192.168.82.171

```

HTTPS traffic analysis

We captured the network traffic using wireshark and analyzed for https traffic by filtering the result using : **tcp.port == 443**

The result was saved in the .pcap file named **https_traffic.pcap**

11. Traffic analysis using Python

HTTPS analysis in captured pcap

Analyzing the HTTPS traffic in a https_traffic.pcap file, with the help of python by using the libraries like `scapy`, `pyshark` to analyse the traffic

Python code Result

```
PS C:\Users\...\Desktop\SHADOW\Share\CTF\Py-script> python .\traffic_analyzer.py .\https_traffic.pcap
Parsing HTTPS packets...

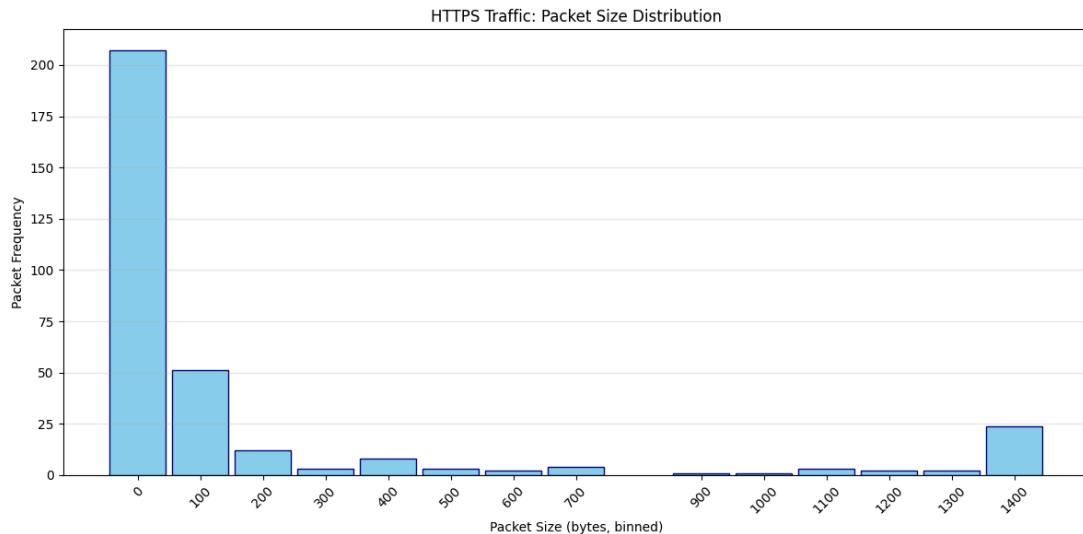

==== PACKET METADATA TABLE ====
IP Address | Packet Count | Avg Size (bytes)
-----|-----|-----
192.168.82.68 | 323 | 245
100.22.192.16 | 128 | 245
104.18.5.247 | 39 | 245
54.92.105.180 | 28 | 245
104.18.27.48 | 25 | 245

Total HTTPS packets: 323
Avg packet size: 245 bytes
Avg inter-arrival time: 92.54 ms

Bar chart saved as 'packet_size_dist.png'
```

Python code result

Python code output

Python code output

12. Key Learnings

- Learned how to capture and analyze network traffic using Wireshark, applying display filters to focus on the required packets for better analysis.
- This task focuses on defense-in-depth through network segmentation, setting up secure network , configuring router, switch and adding rules in firewall
- Developed a Python script using Scapy and Pyshark to analyze the captured pcap file.
- Used Metasploit to exploit the vulnerable service and gained the root shell

13. Conclusion

Implemented secure topologies with VLANs and DMZs significantly reduces breach scope, Metasploit streamlines exploit testing on targets like Metasploitable, and traffic analysis with Wireshark and Python which uncovers HTTPS communication patterns
